

SPACE INVESTIGATION

4

The Bathroom has been put under the stairs because in the previous common room had not been occupied often.

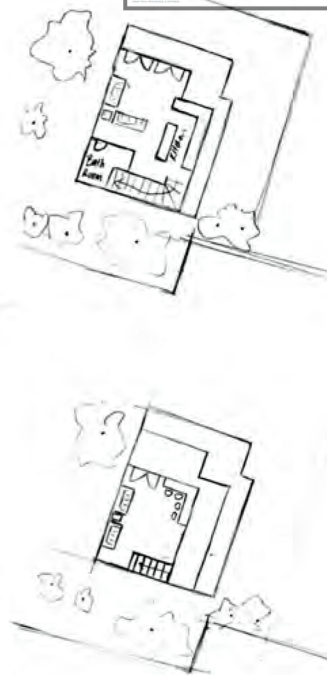

The Relating & Social area have been placed in the front section of the building to get the afternoon sun for a comfortable Relating time.

FLOORPLAN INVESTIGATION

The kitchen has been made larger than the previous common room because of the lack of space & complaints about the access.

The study area has been placed upstairs to give the occupants quiet and an atmosphere to concentrate in.

Other student work submitted has not been included in this exemplar

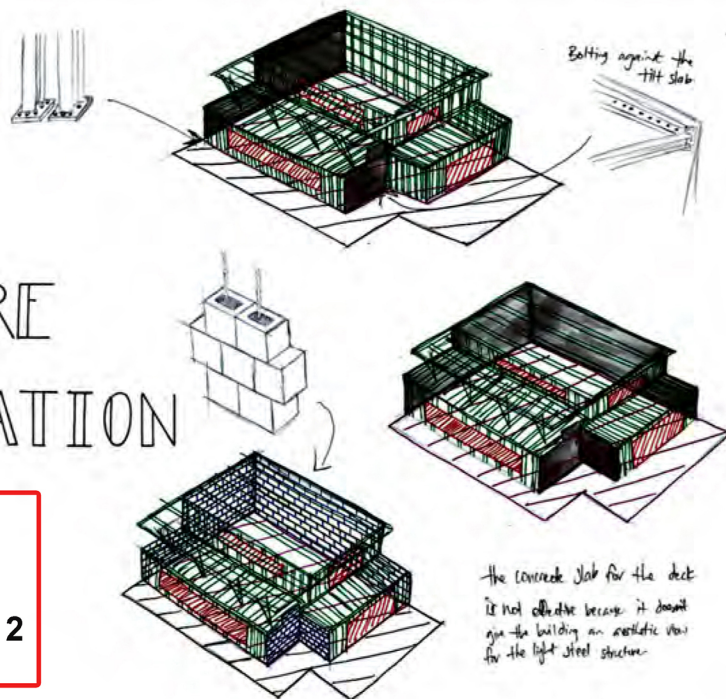

I have chosen the top structure for the senior common room because Modernism is about having a structure look light. Steel creates that effect.

2

STRUCTURE INVESTIGATION

I have not chosen this structure because the brick work does not flow with the modernist flowing effect & therefore is not effective.

2

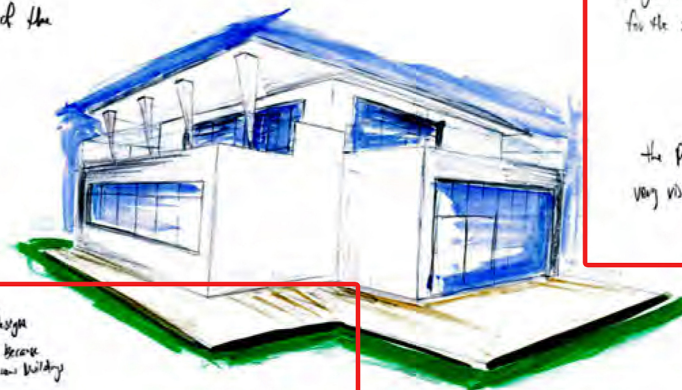

1

The stairs create an open view of the school & open space of the building.

This architectural design enhances the school because it fits with the new building & movement.

2

The building is facing north to give more sunlight & warmth for the students using the building.

The pedestrian access is very visible & easy to access.

The form is very light & strong. This creates the modernist style & shape for the building.

The south cold wind has been access through the back because there is no access.
